

ComicCraft – AI Comic Story Creator using Gemini Models

Phase 8 – Project Demonstration Phase

1. Introduction

The Project Demonstration Phase is the final phase of the ComicCraft project. In this phase, the completed application is demonstrated to show how it works from user input to AI-generated comic content.

ComicCraft accepts a story idea from the user and uses the Gemini AI model to generate:

- Comic title
- Characters
- Story scenes
- Dialogues
- Comic panel descriptions

2. Demonstration Flow

3. Sample User Input

A young girl discovers a magical book in her school library.

4. Sample Generated Output

Title: The Magical Library

Characters:

1. Maya – a curious school girl
2. Luna – a magical character

Scene 1:

Maya discovers an old glowing book.

Dialogue:

Maya: "What is this strange book?"

Scene 2:

The book opens and creates a magical portal.

Dialogue:

Luna: "Welcome to the magical world!"

Panel Description:

A glowing book opens on a library table with magical light surrounding Maya.

5. Demonstration Coding

Backend – main.py

```
from fastapi import FastAPI
from pydantic import BaseModel
import google.generativeai as genai

app = FastAPI()

genai.configure(api_key="YOUR_API_KEY")

model = genai.GenerativeModel("gemini-1.5-flash")

class ComicRequest(BaseModel):
    prompt: str

@app.post("/generate")
```

```
def generate_comic(data: ComicRequest):

    instruction = f"""
    Create a short comic story from this idea:

    {data.prompt}

    Include:
    1. Title
    2. Characters
    3. Scenes
    4. Dialogues
    5. Panel descriptions
    """

    response = model.generate_content(instruction)

    return {
        "comic": response.text
    }
```

Frontend – index.html

```
<!DOCTYPE html>
<html>
<head>
    <title>ComicCraft</title>
</head>

<body>

<h1>ComicCraft</h1>

<input id="prompt"
    placeholder="Enter your comic story idea">

<button onclick="generateComic()" ">
    Generate Comic
</button>

<pre id="result"></pre>

<script>
async function generateComic() {

    let prompt = document.getElementById("prompt").value;

    let response = await fetch("/generate", {
        method: "POST",
        headers: {
            "Content-Type": "application/json"
        },
        body: JSON.stringify({
            prompt: prompt
        })
    })
```

```
});

let data = await response.json();

document.getElementById("result").textContent =
    data.comic;
}
</script>

</body>
</html>
```

6. Running the Project

Install the required packages:

```
pip install fastapi uvicorn google-generativeai
```

Run the FastAPI application:

```
uvicorn main:app --reload
```

Open the application in a browser and enter a story idea.

7. Demonstration Steps

1. Start the ComicCraft application.
2. Open the web interface.
3. Enter a comic story idea.
4. Click Generate Comic.
5. The request is sent to the FastAPI backend.
6. The backend sends the prompt to Gemini AI.
7. Gemini generates the comic story.
8. The generated comic content is displayed to the user.

8. Final Result

The demonstration confirms that ComicCraft can convert a simple user-provided idea into an organized AI-generated comic containing title, characters, scenes, dialogues, and panel descriptions.

Project Phases Completed

Phase 1 → Brainstorming & Ideation

Phase 2 → Requirement Analysis

Phase 3 → Project Design

Phase 4 → Project Planning

Phase 5 → Project Development

Phase 6 → Project Testing

Phase 7 → Project Documentation

Phase 8 → Project Demonstration
